

SYSTEM ARCHITECTURE VERIFIED

# PROJECT ANTIGRAVITY

Sovereign System Architecture: pyTan Demurrage Shield & Logistics Intelligence Pipeline

Author: pyTan Engineering

Target Market: US East Coast Maritime Logistics

Release Date: June 2026

## 1. Core System Architecture

Project Antigravity provides an automated, industrial-scale real-time data ingestion and risk-mitigation pipeline engineered exclusively for mid-market US East Coast freight forwarders, customs brokers, and intermodal drayage networks. The software functions as a protective shield against port storage charges (demurrage fees ranging from \$150–\$500/day per container) by checking and extracting time-critical arrival parameters immediately after transmission.

The system operates systematically across four programmatic stages to eliminate processing latency:

- **Inbox Intercept Layer:** Connects directly to operations inboxes via secure IMAP/SSL protocol. Utilizing unique message IDs, it immediately flags files with an idempotency lock to prevent duplicate system executions across worker schedules.
- **Logical Extraction Layer:** Performs deterministic pattern matching over raw email payloads to extract critical tracking fields with zero API cost or latency overhead.
- **Validation & Safety Gate:** Enforces deep schema matching on structural inputs, vetting shipping container numbers against strict alpha-numeric tracking rules and flagging missing deadline indices.
- **Target Data Routing:** Smooth payloads flow cleanly to production interfaces via structured appending streams, while flagged irregularities are safely quarantined inside standalone compliance buffers.

## 2. Visual Style & Design Tokens

The visual interface follows the rules of Cinematic Minimalism. It creates an immersive, high-contrast digital environment modeled after premium mission control boards, designed to foster instant operational authority during enterprise demonstrations.

| DESIGN TOKEN              | HEX / STYLE VALUE | OPERATIONAL MAPPING                                                                                 |
|---------------------------|-------------------|-----------------------------------------------------------------------------------------------------|
| The Canvas (Surface)      | #0d1515 / #000000 | Deep obsidian backdrop layers to completely isolate high-priority tracking matrices.                |
| The AI Pulse (Primary)    | #00f5ff / #00dce5 | Electric teal indicators used for active system pipelines, accuracy logs, and verification pins.    |
| High Contrast (Secondary) | #ffffff           | Pure crisp white surfaces reserved for human interaction inputs and main triage actions.            |
| Borders & Rules           | #1e1e1e / #3a494a | 1px razor-sharp charcoal dividers that provide structural framework without rendering visual bloat. |
| Typography Layout         | Inter Sans-Serif  | Headline letter spacing condensed by -0.02em; metadata tracking increased by 0.05em.                |

### 3. Frontend Component Mapping

The interface design decouples live processes from administrative tasks, mapping exactly to user views during pipeline run operations.

- **KPI Hero Banner**

Occupies the focal apex of the display space. Dynamically spotlights "**0 Missed Deadlines**" alongside value statements validating aggregate throughput protection metrics.

- **Live Feed Ingestion**

Tracks streaming chronological logs via clean tables, parsing indices like Timestamp, Carrier Document origin, and pill-shaped validation flags matching actual carrier states.

- **Pipeline Terminal**

A fixed tracking console logging live system transactions. Uses persistent state monitoring lines and a custom blinking cursor to illustrate live script performance.

- **Exception Gate Panel**

Quarantines system irregularities for operator evaluation, grouping an active text preview block against primary verification controls to permit rapid data patches.

#### Human-in-the-Loop Safe Isolation Code Sample:

```
{
  "pipeline_run_id": "MDP-20260604-6610",
  "extracted_fields": {
    "vessel_name": "Givens Trader",
    "container_id": "MSCU5566778",
    "free_time_deadline": null
  },
  "validation_failures": ["free_time_deadline: field not found"],
  "status": "Pending Human Review"
}
```

## 4. Value Realization & Escalation Economics

Antigravity shifts enterprise positioning away from typical hourly technical consultations toward value-backed asset deployment. The software architecture enables a highly strategic fee escalator to capitalize on growing industry social proof:

- **The Pioneer Phase (Client 1):** Priced at a low-friction **\$1,000 setup fee** to establish a production-verified case study and validate client parameters safely.
- **The Velocity Escalation (Clients 2–5):** Scales incrementally from **\$1,500 to \$3,000**, with each implementation funding system optimization.
- **The Authority Multiplier (Clients 6–10):** Adjusts into the mid-market tier at **\$4,000 to \$8,000**, backed by hard performance documentation.
- **The Enterprise Ceiling (Clients 11–20+):** Capped at a premium flat rate of **\$16,000 per setup**, yielding a total upfront cash generation structure of **\$188,000** over a 20-account roll-out.

Combined with a rigid baseline recurring retainer model of **\$1,500/month per client**, an operations map spanning 20 accounts yields **\$30,000 in monthly recurring revenue (MRR)**. Given token ingestion compute variables averaging less than \$2.00 per month, the net platform margin stabilizes at a powerful **99.8% profile**. Antigravity positions pyTan as an indispensable operational armor layer for global trade infrastructure.
